

# Master in Artificial Intelligence

## Deployment III

# Purpose

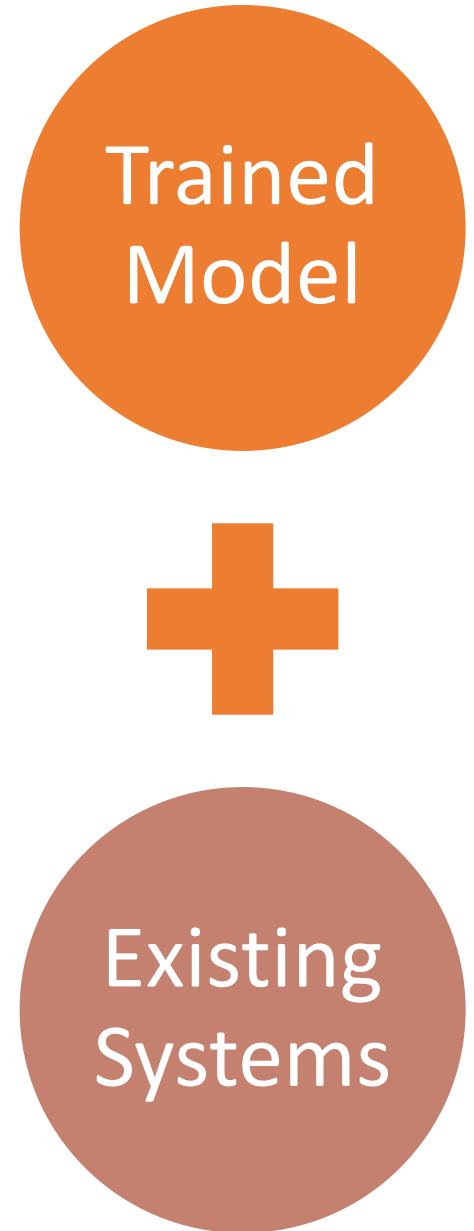

The purpose of the section is to help you learn how to deploy trained models into production environments to become a Successful Artificial Intelligence (AI) Engineer

At the end of this lecture, you will learn the following

- An example of deploying trained models into production environments, ensuring they integrate smoothly with existing systems and meet performance requirements

# Example of how to deploy trained models into production environments

# Serialization of Trained Model

```
import pickle  
  
# Assuming 'model' is your trained sentiment analysis model  
with open('sentiment_model.pkl', 'wb') as f:  
    pickle.dump(model, f)
```

# Setting up a RESTful API

```
from flask import Flask, request, jsonify

app = Flask(__name__)

@app.route('/predict_sentiment', methods=['POST'])
def predict_sentiment():
    # Get text input from request
    text = request.json['text']

    # Load the serialized model
    with open('sentiment_model.pkl', 'rb') as f:
        model = pickle.load(f)

    # Perform sentiment prediction
    prediction = model.predict([text])[0]

    # Return prediction as JSON response
    return jsonify({'sentiment': prediction})

if __name__ == '__main__':
    app.run(debug=True)
```

# Input Data Preprocessing

Implemented

Handled text inputs

# Performance Optimization

Optimized the API endpoint for performance

Consider techniques such as

Minimizing latency

Maximizing throughput

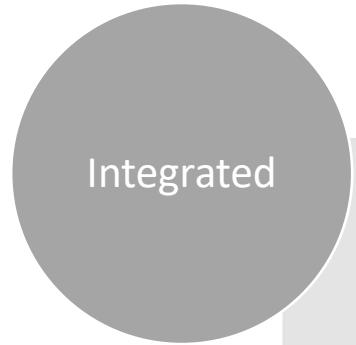

Caching

Batching

asynchronous processing

# Integration with Existing Systems

Deployed API endpoint

With existing systems or applications

That require sentiment analysis functionality

Data formats

Protocols

Authentication mechanisms used by other systems

# Monitoring and Logging

Implement logging and monitoring mechanisms to track

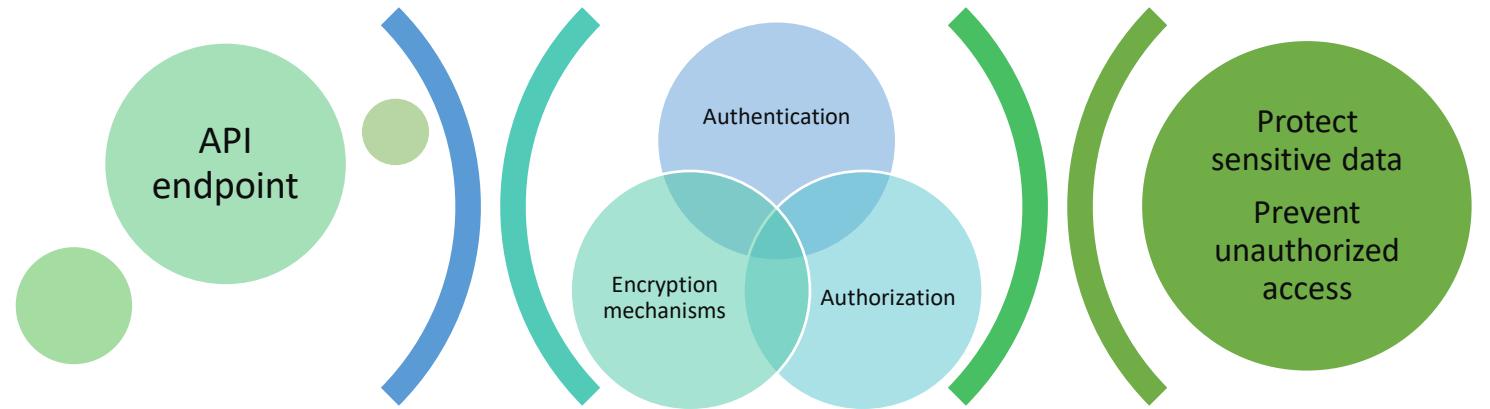

- API usage
- Performance metrics
- Errors in real-time

Monitor key metrics such as

- Response time
- Throughput
- Error rates

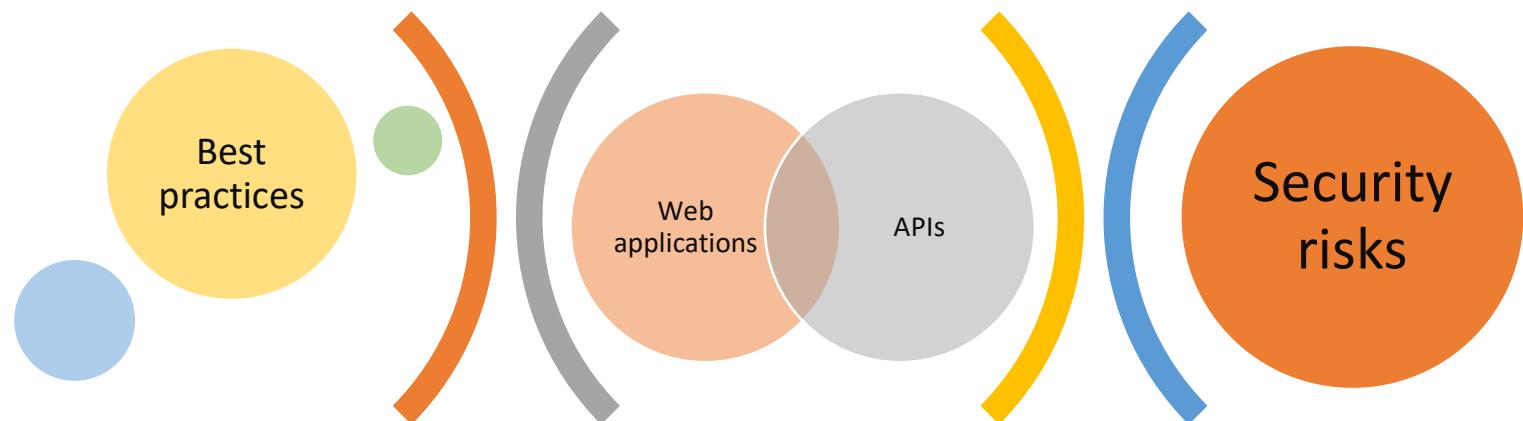

# Security and Authorization

Secured

Implemented

To

Followed

Securing

Mitigate

# Testing and Validation

Conducted

- Thorough testing and validation of the deployed API endpoint
- Ensured correctness, reliability, and performance under various conditions.

Performed

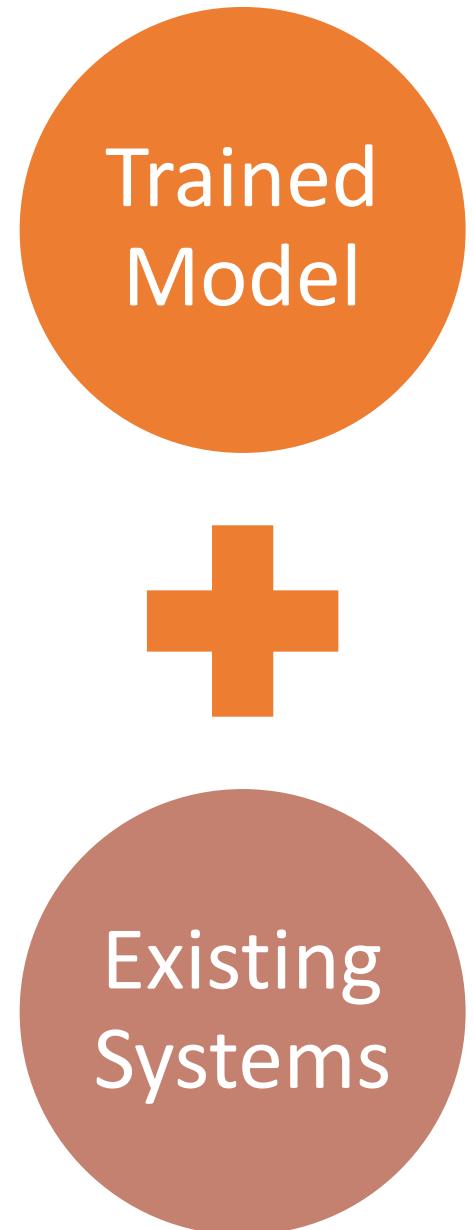

- Integration testing
- Load testing

Validated

- Behavior and performance of API in a production environment
